## AMENDMENTS TO THE CLAIMS

CLAIM 1 (CURRENTLY AMENDED): An apparatus used for detecting the rotation of a bicycle part, wherein the apparatus comprises:

a casing member comprising:

a separate generally annular body structured to be mounted to a mounting boss of the bicycle part other than a wheel spoke so that the annular body is incapable of rotating relative to the bicycle part as the bicycle part rotates in opposite directions around a rotational axis, wherein the annular body includes a plurality of circumferentially disposed exposed magnet mounting portions that are concentric with respect to the rotational axis and are fixed relative to each other during rotation of the casing member; and

a cover member detachably mounted to the annular body for blocking the plurality of magnet mounting portions;

wherein the casing member further comprises:

an inner peripheral surface to fit around an outer peripheral surface of the mounting boss; and

a surface that extends radially inwardly relative to the inner peripheral surface to face an axially facing surface of the mounting boss.

CLAIM 2 (ORIGINAL): The apparatus according to claim 1 further comprising a plurality of magnets correspondingly mounted in the plurality of magnet mounting portions.

CLAIM 3 (ORIGINAL): The apparatus according to claim 1 wherein the cover member rotates together with the annular body.

CLAIM 4 (ORIGINAL): The apparatus according to claim 1 wherein the casing member is made from a nonmagnetic material.

CLAIM 5 (ORIGINAL): The apparatus according to claim 4 wherein the casing member is made from a synthetic resin.

CLAIM 6 (ORIGINAL): The apparatus according to claim 1 wherein the cover member completely covers the plurality of magnet mounting portions.

CLAIM 7 (ORIGINAL): The apparatus according to claim 1 wherein the annular body is structured to be securely fixed to the bicycle part so that the annular body is incapable of rotating relative to the bicycle part.

CLAIM 8 (ORIGINAL): The apparatus according to claim 7 wherein the annular body is structured to be securely fixed to the bicycle part so that the annular body is incapable of axial movement relative to the rotating part.

CLAIM 9 (ORIGINAL): The apparatus according to claim 8 wherein the annular body is structured to be bolted to the bicycle part.

CLAIM 10 (ORIGINAL): The apparatus according to claim 1 wherein the cover member is latched to the annular body.

CLAIM 11 (ORIGINAL): The apparatus according to claim 1 wherein the casing member is structured to be directly mounted to a crank arm.

CLAIM 12 (ORIGINAL): The apparatus according to claim 11 wherein the casing member is structured to be directly mounted to a crank axle mounting boss of the crank arm.

CLAIM 13 (ORIGINAL): The apparatus according to claim 12 wherein the casing member is structured to be directly bolted to the crank axle mounting boss of the crank arm.

CLAIM 14 (ORIGINAL): The apparatus according to claim 12 wherein the annular body comprises:

a tube portion structured to be mounted around an outer peripheral surface of the crank axle mounting boss; and

a ring portion structured to be mounted around an end face of the crank axle mounting boss.

CLAIM 15 (ORIGINAL): The apparatus according to claim 14 wherein the ring portion includes a plurality of holes for receiving a corresponding plurality of bolts therethrough.

Page 6

CLAIM 16 (ORIGINAL): The apparatus according to claim 1 further comprising a stopper member for fixing the annular body to the bicycle part.

CLAIM 17 (CURRENTLY AMENDED): An apparatus used for detecting the rotation of a bicycle part, wherein the apparatus comprises:

a casing member comprising:

a generally annular body structured to be mounted to the bicycle part so that the annular body is incapable of rotating relative to the bicycle part as the bicycle part rotates in opposite directions around a rotational axis, wherein the annular body includes a plurality of circumferentially disposed exposed magnet mounting portions that are concentric with respect to the rotational axis;

a cover member detachably mounted to the annular body for blocking the plurality of magnet mounting portions; and

a stopper member for fixing the annular body to the bicycle part;

The apparatus according to claim 16 wherein the stopper member is structured to fit radially inwardly of the annular body.

CLAIM 18 (ORIGINAL): The apparatus according to claim 17 wherein the stopper member comprises:

- a tubular portion structured to fit radially inwardly of the annular body; and
- a flange portion that axially retains the annular body.

CLAIM 19 (ORIGINAL): The apparatus according to claim 18 wherein the stopper member further comprises a latching portion structured to fit within a stopper groove formed in the bicycle part.

CLAIM 20 (ORIGINAL): The apparatus according to claim 1 further comprising a magnetic sensor structured to be mounted to a part of the bicycle.

CLAIM 21 (ORIGINAL): The apparatus according to claim 20 wherein the part of the bicycle is one of a front fork, a back fork or a chainstay of the bicycle.

TADASHI ICHIDA, et al Application No.: 10/604,888 Page 7	PATENT
CLAIM 22 (ORIGINAL): The apparatus according to	claim 21 wherein the bicycle part is a
wheel hub.
